A sport ecosystem exists based on the type and rate of coopetition existing. Coopetition is defined as "the simultaneous pursuit of cooperation and competition among firms to leverage strategically important resources for superior value creation purposes". It is a useful way to understand the dynamic nature of sport businesses which need to collaborate for resource efficiency purposes but potentially compete with each other. This special relationship should be managed properly due to trust and confidence issues being paramount. It can be challenging to be collaborative and competitive in sport as they involve different forms of behaviour. This means a careful balancing act may be required in terms of the amount of emphasis placed on each activity. Often sport managers will try to be more competitive due to performance reasons and less collaborative. By necessity they may need to share information but do so in a cautious manner. This means it might be better to have plans in place about how to pursue both simultaneously. This will ensure one is not neglected at the expense of the other.

- ① strategies for reducing competition among sport businesses
- ② role of trust in building long-term sport business partnerships
- ③ reasons why sport managers tend to prefer competition to collaboration
- ④ need for managing the balance between cooperation and competition in sport businesses
- ⑤ benefits of sharing resources openly among rival sport organizations

Other agricultural innovations followed—the seed drill, four-field crop rotation, horse shoes,

improvements to plows and scythes, and more. In parallel, farmers continued to pick seeds from the best crops to plant for the next year, and to domesticate more plants and animals for human use. In all, those agricultural innovations boosted yield by a factor of 10 between the first generation of farming and the dawn of the Renaissance. At the end of the so-called dark ages, farms produced twice as much food per acre as they had at the height of the Roman Empire.

There's a saying that "you can't eat information." That may be so, but the food we eat today is the fruit of thousands of years of increasingly high-quality information — the knowledge of how to farm — what seeds, what tools and how to use them, what times of year, what irrigation, what sequence of one crop after another on the same land. What we eat is solar energy, filtered, concentrated, and distilled through the lens of human knowledge. The energy the Earth receives from the sun each year has remained more or less constant through all of human civilization. What's allowed us to flourish is our increasingly sophisticated knowledge of how to capture an ever-growing but still tiny fraction of that energy in a form that can fuel our bodies. Every step in the advancement of our knowledge has brought with it an increase in the amount of energy we can tap into.

In an ideal scenario, individuals would value this service so much that they would pay for it, much in the way that a climber scaling Everest would hire guides to clear the path, carry supplies, and ensure the success of the mission, knowing that value exists in having someone who knows the way. It also would mean that as journalists look out across the coverage areas they aim to serve, there would be no way for them to overlook groups of people and their problems because those citizens would be just as involved in the creation of the news as they are.

Increased community engagement by professional journalists, on their own, will not solve the problem of making the news more relevant to everyone because traditional news organizations already have abandoned many communities, leaving behind news deserts. In those places, citizens must take up the responsibility for discovering information, holding the powerful accountable, and telling the news for themselves and their neighbors. The democratization of information – through the disruptions caused by computers and the internet – allows citizens to retake control of local news in ways that never have existed before, and it calls them to take greater care in the gathering and dissemination of what they discover or think they know. Journalism, perhaps like never before, belongs to the people rather than to professional journalists, wealthy publishers, or even corporate shareholders. The same technology that has shifted the balance of power toward the people gives them the tools to act as broadcasters and publishers of information essential to their immediate community – and, more critically, to serve as gatekeepers to information for other people around them.

To come back to de Tocqueville and his observations from nearly two centuries ago, he recognized then the role of sharing news to support American democracy and (although he would not have used these words) build social capital among the citizens of any community: "Newspapers therefore become more necessary in proportion as men become more equal, and individualism more to be feared. To suppose that they only serve to protect freedom would be to diminish their importance: They maintain civilization.... If there were no newspapers there would be no common activity."

It is a myth that all ideas are equally valid, even those with little or no objective proof. The existence of science is the commitment to objective truth. Use those moments in your life as a starting point for reaching out to others. If you have anxiety as the new person at work, take the time to talk to the other new hires to make them feel at ease. If you struggle with balancing kids and work, take the time to give a word of encouragement to the other new mothers and fathers in your circle. Taking a moment to imagine what other people might be struggling with, possibly the same challenges or worries that you struggle with, can lead to an enormous sense of relief.

If you suffer from social angst, awkwardness, or dread, know that this is a perfectly normal response. No matter what it looks like, a lot of people are dealing with internal anxiety in social situations. But it is actually possible to build your social muscle and use it to _____ your connections — and your anxiety is giving you clues to what icebreakers and lifelines other people might be grateful for you to extend. Truly listen to what your anxiety is signaling to you about where you feel uncertain or insecure, and practice empathy by offering a hand to others who might be in the same boat. Remember that flipping anxiety into compassion is something inherent in you — it is, in fact, what your anxiety was designed to do for you. Together, compassion and empathy can buffer against bad anxiety. You can use your anxiety to be more outward-facing. The outcome? The spread of compassion for your fellow human beings, other species, and the planet!
