Dear Valued Members of the City Sports Center,

- (A) During this brief period, we politely ask you to use the temporary outdoor parking lot located opposite the main entrance. We are fully committed to completing the work as fast as possible.
- (B) We truly apologize for any potential inconvenience this may cause and appreciate your patience and cooperation.
- (C) We deeply appreciate your constant use of our sports center. As already announced, we will be conducting crucial maintenance on our underground parking lot.
- (D) As a result, the underground parking facility will be completely unavailable from April 1st to April 7th.

- (A) Just then, a plastic tray was placed down opposite him. It was a classmate from his math class. "Hi, is this seat taken? By the way, thanks for lending me that pen before."
- (B) Looking around the loud cafeteria, Owen gripped his tray firmly. He felt the huge pressure of being new to the high school.
- (C) Not knowing how the afternoon would go made him feel nervous. He sat with a deep sigh at a corner table. He thought, 'Can I make it through the rest of the classes?'
- (D) The unseen wall around Owen seemed to melt away. "Not at all, please sit," he replied. Starting to feel at ease, he smiled warmly at the guy.

- (A) So when things are tough during such a transition, you have almost nothing else in your life to counterbalance the stress.
- (B) When moving into a new situation, many people decide that they need to master what's new.
- (C) Instead of staying laser-focused, use this transition as the jumping-off point for building new networks to shape the work you want to do and whom you want to do it with.
- (D) To this end, they reduce their connections to people or activities that might distract them from their goal. But that is a mistake. Being too focused can lead to becoming unidimensional – you have few remedies to the microstresses that are inevitably bombarding you at that time.

- (A) Students who are in safe learning environments are willing to risk sharing an incorrect answer with their peers in order to grow mathematically. It is important to model and expect the acceptance of all ideas without derogatory comments.
- (B) The teacher may need to practice having a “blank face.” Students look to teachers as the source of correct answers. Part of building a safe learning community is to shift this source of knowledge to the students by equipping them to defend the thinking behind their solutions.
- (C) A first step toward establishing a respectful classroom learning community is acceptance of all ideas and answers – regardless of any obvious errors. Rich mathematical discussions cannot occur if this expectation is not in place. We must remember that wrong answers are often rooted in misconceptions, and unless these ideas are allowed to be brought to the forefront, we cannot help students confront their thinking.
- (D) As educators we can model this by recording all answers to be considered without giving any verbal or physical expressions that indicate agreement or disagreement with any answer.

- (A) The usual intercity traveler moves slowly through the station area. The passenger may not be familiar with the routine, have baggage to handle and check or retrieve, have a long wait for connections or delayed trains, and may require information, food, and a comfortable place to sit.
- (B) In some instances, separate stations are in use. Clear and concise direction and routing signs and other means of channelization are desirable.
- (C) In some large stations such as Grand Central Terminal in New York City, commuter and intercity trains arrive and depart on different levels. In smaller stations, separate platforms should be used and traffic routed so that the two lines of movement do not cross.
- (D) Commuters, on the other hand, are familiar with the route through the station, have little or no luggage, and are usually in a hurry. They want direct access to or from local streets and transport. These two types of traffic should be kept separate to avoid conflict and confusion.

- (A) At other times we will need a cue to provide a subtle change in atmosphere over a number of minutes, motivated perhaps by the mention of a sunset or the intention to slowly change the feel of the performance from normal to threatening.
- (B) Most performance lighting is made up of a number of different looks which we have called lighting states. Each lighting cue triggers a change to a new state. Like actors, lighting cues usually need a motivation.
- (C) This might be something very obvious such as a cue required to brighten a room setting when an actor turns on a light switch or the rapid increase in intensity at the end of a dance number in a traditional musical (known as a button cue).
- (D) The question, 'What will lighting do for this production?' needs to be asked for each moment of the production, each dramatic unit or scene, and each transition.

- (A) Rooms have their own “sound” because they impose their own characteristics on audio signals contained within them. It’s actually kind of remarkable. Sound such as music coming from headphones will sound the same everywhere. No matter what acoustical environment we are in, the headphones sound the same.
- (B) Similarly, when you are recording a musical instrument, the sound you receive at the microphone will be different in every room and the recorded sound will sound different as the instrument or the microphone is moved.
- (C) That’s because the room is not part of that playback signal path. But sound such as music from a loudspeaker will sound different in every acoustical environment. Every room where you set up the loudspeaker will cause the sound you hear to be different—sometimes dramatically different; that is because the room is now part of the signal path.
- (D) Also, in the same room, the loudspeaker will sound different when it is placed in different locations in the room and it will sound different as you move around the room.

- (A) The chart above shows the proportions of shoppers in the U.S. who were willing to reply to four distinct feedback request approaches in 2023, 2024, and 2025. In every year, the proportion of shoppers who were willing to reply in an email was the greatest among the four approaches.
- (B) In 2025, the proportions of shoppers who were willing to reply to each feedback request approach were identical apart from those who were willing to reply in an email. In 2024, shoppers were more willing to reply to feedback requests made in person than to those made through social media.
- (C) The gap between the proportions of shoppers who were willing to reply in an email and in person was greater in 2024 than in 2023.
- (D) The proportions of the shoppers who were willing to reply in a text message increased annually from 2023 to 2025.

- (A) After earning a doctoral degree in physics from the University of Cambridge in 1953, he became well-known for his studies on the cosmos. Early in his profession, Sciama supported the steady-state theory, which argued that the cosmos had no origin.
- (B) However, when new proof against the theory appeared in the 1960s, he changed his perspective and accepted the Big Bang model. In 1991, he was awarded the Guthrie Medal for excellent contributions to experimental physics by the British Institute of Physics.
- (C) Dennis William Sciama was born in Manchester, England, in 1926. He received an instruction in mathematics and physics at Malvern College. Despite his father's desire for him to take over the family company, Sciama chose to continue pursuing his academic path.
- (D) Sciama's role as a mentor became known even outside academic societies. Afterwards, he was introduced in movies about his most famous student, Stephen Hawking, which made Sciama known to a broader public.

- (A) But even the largest piano makers of that time produced no more than 5-10 pianos per year per worker, as pianos were still made essentially one at a time. The development of a true piano factory occurred first in the United States, led by Jonas Chickering in Boston and later the Steinway family in New York City.
- (B) The Industrial Revolution did more than just invent new materials or machines. It invented a new process for manufacturing: the modern factory.
- (C) These factories led to improvements in both efficiency and quality. For example, one of the factories of the time had its own iron casting facility where it made its metal plates, which were thought to be the best available.
- (D) Prior to around 1850, most piano shops used an apprentice system in which a master builder taught younger workers the skills of the trade, usually over the course of many years. The larger piano shops did have specialists – for example, one person who specialized in soundboards, another who made hammers, and so on.

- (A) In a thesis-based doctoral programme, students typically spend a significant amount of time and effort researching a specific topic. While this deep dive into a particular area allows for thorough exploration and understanding, it can also result in narrowing the focus.
- (B) Consequently, this singular focus may limit the breadth of knowledge and skills developed during the programme, potentially hindering students' ability to adapt to diverse career paths or address interdisciplinary challenges. Some universities in Europe have recognised the limitations of traditional thesis-based doctoral programmes and have started to implement more structured approaches.
- (C) These structured programmes often combine research with coursework and training in transferable skills. By incorporating coursework, seminars, workshops and internships into the curriculum, they aim to provide students with a broader skill set and better prepare them for a variety of career paths beyond academia.
- (D) As students become deeply absorbed in their research, they may spend less time exploring related fields or acquiring skills outside their immediate area of study.

- (A) Indeed, research shows that children have a more difficult time displaying their understanding of the causal relations between imagination and reality when they are asked to pretend or imagine scary things, like monsters.
- (B) However, emotion can sometimes disrupt this understanding, or at least its expression. That is, even though a child knows that monsters are not real, the thought of a monster under a bed might be enough to make a child refuse to go into his room at night.
- (C) In one study, preschool children were shown an empty box and were asked to imagine a monster inside. All children agreed that the box was empty. However, when they were left alone with the box they exhibited fear and avoidance of it.
- (D) Research shows that, by age three, children understand that imaginary objects do not come to life. This is especially clear with respect to everyday objects –children know that even though they imagine a pencil in an empty box, the box will remain empty.

- (A) In that book Dewey argued against the separation of art from life by basing aesthetic experience on the biological and cultural conditions of human life. He located the aesthetic, not in an internalized awareness of sensation and feeling but in "a complete interpenetration of self and the world of objects and events."
- (B) Perhaps the best-known development to emerge from the liberation and expansion of aesthetic experience is the aesthetics of everyday life. Although there is presently a flowering of work on everyday aesthetics, the possibility of aesthetic gratification in ordinary objects and events has long been recognized, even if degraded and dismissed by prevalent philosophical theory.
- (C) Further, Dewey maintained that "the aesthetic is the clarified and intensified development of traits that belong to every normally complete experience."
- (D) Widely valued by poets, especially Romantic poets and those in Asian traditions, the aesthetic in everyday situations has also been recognized by novelists. It may be most convenient, though, to locate its contemporary intellectual origins in John Dewey's *Art as Experience*.

※ 다음 문단의 순서를 바르게 배열하시오.

- (A) One cannot validly argue that humans are morally superior beings on the ground that they possess, while others lack, the capacities of a moral agent. The reason is that, as far as moral standards are concerned, only beings that have the capacities of a moral agent can meaningfully be said to be either morally good or morally bad.
- (B) This would not be the case, however, if humans were being judged superior to animals and plants, since the latter are not moral agents.
- (C) One entity is correctly judged morally superior to another if it is the case that, when valid moral standards are applied to both entities, the first fulfills them to a greater degree than the second. Both entities, therefore, must fall within the range of application of moral standards.
- (D) Only moral agents can be judged to be morally better or worse than others, and the others in question must be moral agents themselves. Judgments of moral superiority are based on the comparative merits or deficiencies of the entities being judged, and these merits and deficiencies are all moral ones, that is, ones determined by moral standards.

- (A) AI's 'humanity' of silence emerges in these contexts not least because a short period of silence is likely to be interpreted as a 'pause for thought', therefore reinforcing the illusion that the machine is 'thinking' before responding, just as a human might.
- (B) However, the technical issues flagged in AI's poor handling of higher duration and frequency silences, no less than the machine inference that silence can be filled with relevant sounds in some conversational situations, are both significant.
- (C) Such artificial 'pause fillers' as machine-generated supplements for silence may help to produce a more natural-sounding cadence in machine-generated speech patterns and so help to convince the AI's human interlocutors that they are engaging with another human.
- (D) In this context at least, the AI may be starting to recognise silence not as an absence but as meaningful data. Yet the AI's confusion when presented with substantial silences, and its understanding that short break tags are equivalent to vocal markers such as 'uh's' and 'ah's' indicate the AI's continuing preferences for sound over silence, for presence over absence.

- (A) After his return from China in 1295, a century and a half before printing, Polo's narrative was copied in about 150 different manuscripts, with so many differences that we're not sure which version is authentic.
- (B) Standardization of information was an effect of printing; since it allowed exact reproduction of information in a way that manuscript copying did not. This is evident in the contrast between the travel logs of Marco Polo and those of Christopher Columbus.
- (C) So the certainty of accuracy was a way that printing was an improvement over the old oral-manuscript culture.
- (D) In contrast, there is only one version of Christopher Columbus's letters about the exploration of the Caribbean in the 1490s, since they were fixed in printed form and widely distributed at the time they were written.

- (A) Despite this need, only a small portion of the Earth's surface is suitable for farming due to limitations such as climate, topography, soil quality, and technology. Political and economic factors, including land ownership patterns, environmental laws, and population density, also influence agricultural land use.
- (B) In fact, the amount of land used for agriculture has been declining. In 2013, around 18.6 million square miles was used for food production, compared to 19.5 million square miles in 1991.
- (C) However, the growing global population will always demand more food. It is projected that by 2050, the world's population will increase to 9.7 billion, which will require global food production to rise by at least 70% to meet demand.
- (D) Archaeological evidence suggests that various crops were being cultivated as early as 9500 BC in the Levant. Over the millennia, continuous innovations have boosted agricultural productivity while reducing manual labor.

※ 다음 문단의 순서를 바르게 배열하시오.

- (A) By contrast, terms for less central category members are often built up from the core terms – like mother-in-law and step-father. If we compare languages across the world, we can ask what kinship relationships are typically expressed with core terminology, and what relationships are expressed by modifying the core terminology.
- (B) If we add other family relationships to this category – son, grandmother, aunt, brother-in-law, cousin – we are defining the category of kinship terminology. Comparative typological studies of kinship terminology have discovered that languages have labels for some but not all family relationships.
- (C) If you are going to compare languages, it helps to start with something that you are confident you can find in all languages. Take for example signs or words for mother and father.
- (D) And the probability that a specific kin relationship has a label is predictable based on the other kinship terms in the language. For example, all languages have a core set of kinship terms – like mother and father.

※ 다음 문단의 순서를 바르게 배열하시오.

(A) For example, a child pretending to be Peter Pan might gasp and draw a plastic knife. This might be sufficient to communicate that fictionally one of Peter's enemies, such as Captain Hook, is approaching.

(B) There are several ways that participants in a make-believe can communicate things about the fictional world to other participants. Sometimes these messages are emitted naturally as a result of full participation in the fictional world – i.e., something said or done by a player while in character communicates some things that are fictional of that world.

(C) These in-character behaviors can be insufficient, however, to maintain the necessary amount of common ground about what is fictional in the world of the make-believe.

(D) At these times participants often come at least partly out of character to give other participants the information they need. For example, it would be important to avoid confusion about who is playing which character: "No, you're Captain Hook, and I'm Peter Pan!"

※ 다음 문단의 순서를 바르게 배열하시오.

- (A) Therefore, when we think of melting or boiling or the creation of plasma, we intuitively assume it reflects an increase in temperature. This bias comes from the fact that we live in a very constant pressure environment.
- (B) Since pressure is controlled by the weight of overlying material, pressures increase rapidly with depth. Imagine the pressures generated by the weight of rock a mile thick! For this reason a planet's pressure ranges are enormous—from essentially zero pressure in space to pressures of millions of atmospheres in planetary interiors.
- (C) Even small changes in pressure, such as those we experience when under water or on high mountaintops, can have very large effects on our metabolism. But the pressure changes we experience are trivial compared to the pressure range of the overall planetary environment.
- (D) Our intuition about states of matter comes from our experience on Earth's surface, where the pressure is uniformly low and variations in temperature cause changes in the state of matter from solid to liquid to gas.

※ 다음 문단의 순서를 바르게 배열하시오.

- (A) When self--experimentation and conventional experiments are both possible, the difference between them often resembles the difference between learning and showing: Self--experiments are better for discovery but worse for convincing others that the solution is helpful or the answer is correct.
- (B) Then the researcher uses self-experiments to find the procedural parameters (e.g., duration, time of day, intensity) that optimize the solution or maximize the effect. Only then would the researcher begin conventional experiments, using the optimized parameters.
- (C) Of course, most scientists want to do both – discover something and convince others of their discovery. Thus, psychologists should consider doing both self-experiments and conventional ones.
- (D) The best use of resources may often be self-experiments followed by conventional ones. The researcher begins with self-experiments that, if all goes well, find large effects and / or generate and eliminate many hypotheses. This exploratory and theory-building phase lasts until a convenient solution or large effect is found.

※ 다음 문단의 순서를 바르게 배열하시오.

- (A) As statistical analysis became more sophisticated, the visualizations that resulted became more and more central to the argument. In some cases, the visualization made perspective possible. These success stories demonstrated the worth of statistical analysis and visualization.
- (B) Mathematics, natural sciences, and social sciences that employed statistics were at the forefront of the development of charts and graphs. History was a consumer, not a designer, of most of these new visualizations – and mostly a sparing consumer at that, since economic and social history lagged behind political history as an area of research.
- (C) The emergence of the social sciences in the nineteenth century and the ability to work with large datasets created demand for new ways of visualizing information. Processed numerical information was best expressed in tables, charts, and graphs.
- (D) Simple charts and graphs were not difficult to interpret, and their visual conventions became part of what any ordinary reader would be expected to follow.

★ 지문 변형

- (A) At first, Alden felt disappointed and believed the expert was mocking him. However, as he continued observing the stone, he gradually discovered beauty within it and became deeply engaged in painting it.
- (B) Alden was a youthful ambitious painter who dreamed of becoming the most prominent creator in the realm. He traveled a long distance to meet Master Roman and eagerly showed his paintings, expecting praise, but instead received a simple gray rock with instructions to paint what is genuinely inside.
- (C) A few days later, Alden returned to Master Roman with his canvas. As the expert examined the painting, a gentle smile spread across his face, revealing that Alden had captured the hidden beauty within the stone.
- (D) Unwillingly, Alden took the stone to his place. For days and nights, he stared at it, annoyed, as it seemed nothing more than a rough, gray lump. However, as he observed it in the shifting illumination of sunrise and sunset, he began to notice hidden details such as tiny quartz pieces and patches of dried moss.
