Dear Ms. Lopez,

We are writing to convey our gratitude for your dedication as a Spanish instructor. Your exceptional teaching skills have led to a significant improvement in our students' progress and confidence in the language. As the school year approaches its end, it is time for us to reflect on your valuable contributions and consider the renewal of your contract. Given the positive influence you have had, we are pleased to offer an extension of your contract for the forthcoming academic year. It is our belief that your continued involvement will further enhance the learning experience and academic achievement of our students. We look forward to your response.

Sincerely,

James Martin

Principal

- ① Ms. Lopez는 새로 부임한 스페인어 교사이다.
 ② 학생들의 스페인어 실력과 자신감이 크게 향상되었다.

Holding his three-year-old daughter, Peter entered the brightly lit hospital lobby, leaving the freezing air of the night behind. Inside, the harsh lighting seemed to make her appear even more sick, her face flushed and moist with sweat. Despite his best attempts, the fever that began abruptly before dinner refused to decrease. He described her symptoms at the reception desk, and with each passing moment, his concern was growing. Promptly, they were led to a doctor, who reassured Peter and carefully examined the little girl. After an injection from the doctor, her temperature dropped and she appeared much more comfortable. _____.

- ① As Peter realized the severity of her condition, anxiety overwhelmed his thoughts
 ② As Peter watched her sleep peacefully later that night, a great sense of calm washed over him
 ③ As Peter questioned the doctor's diagnosis, doubt crept into his mind
 ④ As Peter prepared to leave the hospital, frustration consumed his emotions
 ⑤ As Peter called his wife with updates, panic filled his voice

So the next time you see a challenge, a tough situation, think like a teabag and dive headlong into it. It may be the opportunity you've been waiting for to show what you are capable of. Some of us are so scared of being scalded by the hot water that we stay away from it. The fear of failure. Don't let that happen to you! Give yourself a chance to show the world what you are really all about!

Imagine you have the best tea in the world and you put it into a bag that's ① impermeable. It won't work. You just won't be able to make a cup of tea. For the teabag to work, it needs to be ② porous. You need the tea and the water to come in contact with each other. In our lives too, we cannot ③ survive and thrive in isolation. Leaders need to be careful not to build walls around themselves that ④ encourage people from reaching out to them. As a leader, you need to be able to touch other people. The tea was meant to mix with the water. Similarly all of us were designed to work with other people, with teams, and with society at ⑤ large.

Teabags work, never mind where they are in the cup. Once you dip a teabag in a cup, it doesn't matter where the teabag sits. It could be at the top, on the side or right at the bottom, it will still work. The teabag's efficacy is not linked to its position in the cup.

* impermeable: 스며들지 않는

** porous: 구멍이 있는

Secondly, there are those needs which, though natural, are not necessary, such as the gratification of certain of the senses. I may add, however, that in the report given by Diogenes Laertius, Epicurus does not mention which of the senses he means: so that on this point my account of his doctrine is somewhat more definite and exact than the original. These are needs rather more difficult to satisfy. The third class consists of needs which are neither natural nor necessary, the need of luxury and prodigality, show and splendor, which never come to an end, and are very hard to satisfy.

It is difficult, if not impossible, to define the limits which reason should impose on the desire for wealth: for there is no absolute or definite amount of wealth which will satisfy a man. The amount is always relative, that is to say, just so much as will maintain the proportion between what he wants and what he gets: for to measure a man's happiness only by what he gets, and not also by what he expects to get, is as pointless as to try and express a fraction which shall have a numerator but no denominator. A man never feels the loss of things which it never occurs to him to ask for: he is just as happy without them: whilst another, who may have a hundred times as much, feels miserable because he has not got the one thing he wants. In fact, every man has a horizon of his own, and he will expect as much as he thinks it is possible for him to get.

If an object within his horizon looks as though he could confidently reckon on getting it, he is happy; but if difficulties come in the way, he is miserable. What lies beyond his horizon has no effect at all upon him. So it is that the vast possessions of the rich do not agitate the poor, and conversely, that a wealthy man is not consoled by all his wealth for the failure of his hopes. Riches, one may say, are like sea-water: the more you drink the thirstier you become; and the same is true of fame. The loss of wealth and prosperity leaves a man, as soon as the first pangs of grief are over, in very much the same habitual temper as before; and the reason of this is, that as soon as fate diminishes the amount of his possessions, he himself immediately reduces the amount of his claims.

* fraction: 분수 ** numerator: 분자

*** denominator: 분모

Restaurants employ carefully chosen words, aiming to create vivid mental images of delectable food and desserts to draw prospective customers to their specific locations. In a similar fashion, nature possesses its own dining establishments. Just as restaurants have a financial dependence on attracting numerous patrons, the natural world's restaurateurs—which are flowers—must also persuade potential diners to sample their offerings. In the world of nature, no neon signs or catchy phrases exist to market a potential meal to hungry animals. These establishments that I am referring to are the planet's flowers, and their potential guests consist of a host of organisms that visit them to obtain nectar and other valuable resources. Rather than using written language, they effectively promote their provisions through the language of scent.

6. 다음 빈칸에 들어갈 말로 가장 적절한 것은?

Would you rather receive \$1,000 in a year, or \$1,100 in a year and a month? Most people will opt for the larger sum in thirteen months, since a monthly interest rate of 10 percent is a rare find. It is a wise choice, as the interest will generously compensate you for any risks faced by waiting the extra few weeks. Now for a second question: would you prefer \$1,000 in cash right now or \$1,100 in one month? If you are like most people, you will take the \$1,000 immediately. This outcome is quite amazing. In both scenarios, an extra \$100 is gained by holding out for just one more month. The logic in the first instance is simple enough: one might reason, "I've already waited a year, what is one more month?" This is not so in the second case.

----- This phenomenon is known as hyperbolic discounting. The closer a reward is, the higher our "emotional interest rate" climbs, and the more we become willing to give up in exchange for it.

- ① The introduction of "now" is what causes us to make inconsistent decisions
- ② The lack of immediate gratification leads to more rational financial planning
- ③ The complexity of long-term calculations prevents accurate decision making
- ④ The uncertainty of future economic conditions influences our current choices
- ⑤ The difference in reward amounts becomes less significant over longer periods

Such studies involve recording the hand and arm movements of unborn children in the womb, using ultrasound images to do so.

Of central importance for comprehending the development of handedness is the answer to when it is actually determined whether a child will favor their left or right hand. For a long time, the prevailing belief was that handedness could only be reliably identified in elementary school when a child learns to write; however, this assumption is incorrect. (①) Indeed, scientific research reveals that handedness is established in many children well before grade school —interestingly, for most people, this occurs even before birth. (②) This method has shown that a clear preference for the movement of the right arm exists as early as 10 weeks after conception. (③) In one such study, ultrasound images of 72 fetuses 10 weeks after fertilization were evaluated, revealing that 85% demonstrated more movements of the right arm than the left. (④) This figure is already very close to the approximately 89.4% of adults who are right-handed. (⑤)

This simple method helps you trace the main outlines of your reference image onto a sheet of paper. First print out your reference at the size you plan to draw it. You can find an image online, or you can use one of the paintings in this book. Then place a sheet of tracing paper over the printout, and trace the outlines. Coat the back of the tracing paper with an even layer of graphite, and place it over a sheet of drawing paper, graphite-side down. (Instead of coating the back of the tracing paper, you can use transfer paper, which already has one side coated with graphite.) Tape or hold the papers together, and lightly trace your outlines with a pencil. The lines of your tracing paper will transfer to the drawing paper below.

Perspective is a technique that allows you to represent three-dimensional objects on a flat surface or plane.

In art, there are a number of ways to use perspective to obtain the illusion of depth, including using colors and graduated values of black and white, and accurately drawing the subject by applying the rules of the geometric system of perspective. In order to achieve perspective, you must make a number of observations. The forms or objects that you draw on a flat surface actually have depth and dimension in real life. As you view them and place their shapes and forms on a drawing surface, try to represent that depth to make the objects appear realistic and three-dimensional. Objects appear differently when viewed from various positions. Because of this, it's important to establish the viewpoint, and stick with it. When observing a subject, you see depth and three dimensions. When you draw this subject onto a flat surface as it appears to the eye, you are drawing in perspective.

The "keyhole" sketching method will help you draw an object in front of you. Place the object that you want to paint or draw on a sheet of paper. Then choose the angle that you want to view the object from, such as directly in front of you or from the side.

11. 다음 글의 내용을 한 문장으로 요약하고자 한다. 빈칸 (A), (B)에 들어갈 말로 가장 적절한 것은?

This, of course, is an everyday thing that's taken for granted by consumers. We expect our products and services to get better and cheaper, at least after the initial period of mass market adoption. If they can't be cheaper, they need to be at least better in terms of quality. This has happened for computers, high-definition televisions, and a host of other electronic products. The prices of many commodities and raw materials are also lower in the long trend (except for oil, which is subject to geopolitical meddling and cartel-ruled decisions). But this can only happen in an economy driven by improving productivity and better technology, so that it is constantly able to produce more and better goods and services. Again, this illustrates the singular importance of the supply side of an economy regarding its growth.

The recent drop in oil prices is a good example to highlight. While there was palpable apprehension of the crashing oil shares, economically, there wasn't much reason to fret over lower prices.

Low oil prices are a good thing, because it means lower energy costs of production for the majority of industries, not least the automobile and the logistics industries. Firms directly benefit from the decrease in their costs of production and provision of services. This has the effect of stimulating the aggregate supply and provides a stimulus for growth. Conversely, a sudden rise in oil prices due to a shrink in oil production is never good news, even though it definitely gives a big boost to the energy sector. A look through the history of oil price fluctuations approves this notion, as this has been the subject of much economic research. Following an oil price jump of 10 per cent due to a contraction in supply, an economy (as typified by the US economy) typically sees its output (GDP) slowed by close to 1 percentage point. For a \$15 trillion economy, that is a loss of \$150 billion in potential wealth or economic growth. Conversely, there has never been much concern with oil price decreases following an excess in its supply.

Throughout history, there are numerous examples

of major increases in supply, most often led by technological advances, giving a kick to productivity and leading to increases in income and living standards. It is important to stress that the concept of supply here adopts a very wide interpretation. It refers to the provision of every kind of good and service, including the services of healthcare and education, and comprises both quantity and quality. Essentially, progress in the medical sciences, improvement in healthcare services, and better education can all be considered in some measure to be increases in the aggregate supply. The essential point is that there needs to be a supply of something, either a good or service, for there to be an improvement in economic and social well-being of an individual or a collective society, most often (but not necessarily always) symbolised by a rise in income.

12. 다음 글의 주제로 가장 적절한 것은?

Our brains are complex webs of associations, and we can access a piece of info in many different ways. The more a new fact connects with the existing network of associations in our brains, the more likely we are to remember it.

We might forget an anecdote about a stranger because it makes few connections with our existing associations, but we won't forget a piece of gossip about our cousin. There's one complex network that is larger and quicker to access than all others - the self. We've been thinking about ourselves in our

whole lives. (In fact, there were entire years during junior high when we weren't capable of thinking about much else.) So if a new piece of information has something to do with us, it will be more easily and thoroughly processed. It hits even closer to home than our actual home - we can take a vacation away from our home, but not from ourselves. The most effective communicators find ways to make the abstract personal. Consider the warning that law schools give to motivate first-year law students concerning the rigors of their program. Hearing that "the first-year dropout rate is 33%" is an abstract statistic. "Look to your left, look to your right. One of the three of you won't be joining us next fall" wakes up the self.

We feel something.

Suppose the numbers have nothing to do with me. Even if the numbers are not my numbers, the right pitch might conceivably tempt me to think about how your numbers would affect my life. It's intriguing to imagine alternate versions of ourselves.

In the next example, someone-let's say a development economist-wants us to understand the precarious position of a Kenyan family." That may be as simple as asking listeners to imagine spending the majority of their money on things like food.

* rigor: 엄격함

14. 글의 흐름으로 보아, 주어진 문장이 들어가기에 가장 적절한 곳은?

Now after hatching, turtles heading for the brightest nearby lights were being guided straight into traffic.

But recent generations of sea turtles have been making some awesome errors in their decision making. When presented with the option of crawling either toward the ocean or away from the water onto asphalt full of oncoming eighteen-wheelers, thousands of turtles have been choosing the latter, fatally irrational option.

A Florida man was recently inspired to find a cure for this new wave of chelonian self-destructiveness.

A news article titled "Fort Lauderdale Saves Turtles from Suicide" explains his radical solution for reducing turtle decision errors: turning off the distracting lights.

Turtle hatchlings have, it seems, evolved to crawl toward the light. For millions of years this was a highly rational and effective strategy because the light on a dark beach represented the reflection of the moon and stars on the water's surface. (①) Following the lights led baby turtles back home to the sea. (②) The problems started when humans began building beachfront homes and sparkling hotels on the other side of the beach. (③) Are self-destructive sea turtles naturally irrational? (④) Yes, in the modern world. But there's a deeper truth. (⑤) Turtles are basing their decisions on simple cues that were perfectly rational for their ancestors: these days, however, their evolved decision-making mechanisms are being blinded by modern lights.

Modern humans have something in common with suicidal turtles. We too have deeply rational decision-making mechanisms, and our machinery is also sometimes blinded by features of the modern world.

Behavioral economists and psychologists studying judgment and decision making have constructed a hilarious house of errors, often showing with great fanfare that humans are like suicidal turtles. Step right up, folks, and see the amazing Stupidman! Just pay your \$20 and look in the mirror! And for a mere \$50, you can look twice!

15. 다음 글의 내용과 일치하는 것은?

The initial response of a sensory receptor to a stimulus is to change its cell membrane permeability to ions—how many ions it lets through. In other words, in response to an appropriate stimulus, transport pathways for specific ions open and/or close, depending on the type of stimulus and receptor.

Sensory organs are the only channels of communication between the brain and the outside world. Simply put, the brain is not designed to sense on its own. For instance, an exposed brain would neither sense light shining on it nor feel something touching it. In fact, patients are often kept awake during brain surgery, which can help a surgeon isolate specific regions of the brain. The ancient Greek philosopher Aristotle recognized this characteristic of the brain over 2,000 years ago when he said, "Nothing is in the mind that does not pass through the senses." This concept can be seen clearly when volunteers are blind-folded and placed in the warm water of a sensory deprivation tank. They soon experience visual, auditory, and tactile (touch) hallucinations, as well as incoherent thought patterns. From these experiments and others, it is apparent that we need constant input from our senses to carry out functions that give us personality and intellect.

This, in turn, influences the movement of a charge across the cell membrane, resulting in a graded change in the membrane potential (voltage), which is called a receptor potential. The magnitude of a receptor potential is directly related to how strong the stimulus is. If a receptor potential is large enough, it may result in a conscious sensation by the brain (that is, a conscious awareness of the stimulus). However, much of the sensory information that goes to the central nervous system is filtered out by specific parts of the brain: as a result, no sensation is perceived for many stimuli. This is important because the brain would otherwise be overloaded with too many signals to sort through. For instance, we usually are not aware of our muscle tension or blood pH levels. We also have the ability to listen to a friend in a noisy restaurant, while simultaneously "tuning out" the myriad other conversations and sounds around us.

According to the writer and zoologist Desmond Morris, it has been observed that our feet convey exactly what we think and feel more honestly than any other bodily part. What makes our feet and legs such truthful reflectors of our emotions? Reacting to environmental threats like hot sand or aggressive lions, our legs and feet responded instantaneously for millions of years, long before the advent of human speech, all without requiring any conscious thought. Our limbic brains ensured our feet and legs responded appropriately, whether by ceasing movement, fleeing, or striking at a possible danger. This survival mechanism, a legacy from our ancestral heritage, has proven effective for us and remains so even now. Indeed, these ancient responses are so deeply embedded within us that upon being presented with a situation that is perilous or even disagreeable, our feet and legs respond just as they did during prehistoric times.

* limbic: (대뇌) 변연계(邊緣系)의

The black-and-white photo of my dad started out as a white piece of paper coated in a fine gel containing silver bromide and silver chloride molecules. In 1939, when the light bouncing off my dad entered the camera lens and fell onto the photographic paper, it transformed the silver bromide and chloride molecules into little crystals of silver metal, which appear as specks of gray on the paper. If the paper had been removed from the camera at this point, the image of my dad would have been lost. This is because all the white areas where there was no image would be flooded with light, causing them instantly to react as well and creating a completely black photo. To prevent this, the photo was "fixed" in a darkroom with a chemical that washed away the unreacted silver halides from the paper. This left only the silver crystals embedded in the layer of gel on the surface of the paper. Once dried and processed it was the image of my dad that enabled him, rather than some other boy, to escape the concentration camps.

My dad is still here to tell the tale, but one day there will only be the photograph to remind us of this moment in time—a material fact of history that contributes to our collective memory. Of course, photographs are not really unbiased, but then neither are memories.

The transition from an oral culture, in which knowledge was handed down through stories, songs, and apprenticeships, to a literate one, based on the written word, was held back for centuries by the lack of suitable writing material. Stone and clay tablets were used, but they were prone to fracture and were bulky and heavy to transport. Wood suffers from splitting and is susceptible to decay. Wall paintings are static and space is limited. The invention of paper, said to be one of the four great inventions of the Chinese, solved these problems, but it wasn't until the Romans replaced the scroll with the codex - or, as we call it now, the book - that the material reached its full potential. That was two thousand years ago, and it is still a dominant form of the written word.

It is the thinness of paper that proves to be one of its great advantages, allowing it the flexibility to survive continuous handling, but when stacked together in book form becoming stiff and strong—essentially a reformed block of wood. With the use of hard covers to hold it all together, the book is a fortress for words for thousands of years.

The genius of this so-called codex format—a stack of papers bound to a single spine and sandwiched between covers—and the reason why it usurped the scroll, is that it allows for text on both sides of the paper and yet still provides a continuous reading experience. Other cultures achieved something similar with the concertina format—forming a stack by repeatedly folding one continuous sheet of paper in on itself—but the advantage of the codex, with its individual pages, is that many scribes could work on the same book at the same time, and after the invention of the printing press many copies of the same book could be created at the same time. As biology had already discovered, the speedy copying of information is the most effective way of preserving it.

18. 글의 흐름으로 보아, 주어진 문장이 들어가기에 가장 적절한 곳은?

But is our analysis of the situation clearly expressed in just one statement? Hardly.

A reason for a conclusion is very unlikely to consist in a single claim. No matter how we might state it in short-hand, it is, analytically, a complex interaction of many ideas and implications. (①) The reason must be broken down into a chain of more precise premises. (②) For example, the claim that 'university education should be free for all Australians' might be supported by the reason that 'the economy benefits from a well-educated Australian population'. (③) The conclusion is about universities and free education, while the reason introduces some new ideas: economic benefit and a well-educated population. (④) While the link between these two ideas and the conclusion might seem obvious, the purpose of reasoning is to avoid assuming the 'obvious' by carefully working through the connections between the various ideas in the initial statement of our reason. (⑤)

- ① (A) - (C) - (B) ② (B) - (A) - (C)
 ③ (B) - (C) - (A) ④ (C) - (A) - (B)
 ⑤ (C) - (B) - (A)

19. Which of the following questions CANNOT be answered based on the information in the passage?

As international migration has increased in recent decades, the pluralism of Southeast Asia's past has been largely forgotten. Migrants are considered to be permanent outsiders with little chance for citizenship and belonging. These ideas— reinforced with harsh policies that restrict mobility, forbid family reunification among immigrant workers, and even use pregnancy as a reason for expulsion—do little to encourage public tolerance or integration.

The word "migration" is almost always reported in the popular media and even in scientific literature as a problem or a crisis. For example, migrants are assumed to overcrowd cities, clog up labor markets, and increase poverty. The other questionable assumption is that most migration is involuntary—people fleeing natural or man-made disasters. The reality, however, is more complex, and

many migrants are simply seeking greater economic opportunity. Of course migration can and does create social and economic problems. But migration can also be a solution for many preexisting problems. For example, out-migration generally redistributes workers from places of labor surplus to areas where there is greater demand or more opportunity. Migration is generally selective of persons who are younger, healthier, more flexible, and more willing to endure hardship in hopes of a better life relative to their prospects in their places of origin. Most research that examines long-term outcomes of migration, including remittances and intergenerational mobility, finds positive "long-term" effects on places of origin and destination.

Along with much of the world, Southeast Asia is currently experiencing increasing levels of migration—both domestic and international. The first step toward understanding an important issue is careful measurement of its dimensions: magnitudes, patterns, and trends. Our analysis in tables 7.2 to 7.4 is a rudimentary description of recent trends in international migration to and from Southeast Asian countries. Basic description can, however, set the stage for more in-depth research. One of the most striking findings of this chapter is that emigration is more pervasive in Southeast Asia than immigration. Even for the countries experiencing high levels of immigration, emigration is also very high. Rapid economic growth appears to be highly correlated with above-average levels of immigration. It also seems that demography, economic stagnation, and political unrest are the primary factors that determine emigration.

* clog: 막히게 하다 ** remittance: 송금

- ① How is migration primarily portrayed in popular media?
 ② What are some questionable assumptions about migration?
 ③ Why can migration be a solution for preexisting problems?
 ④ How many people migrate globally each year?
 ⑤ What do long-term studies on migration outcomes reveal?

20. 다음 글의 제목으로 가장 적절한 것은?

None of this is hard to understand. Complications and confusion come in when we start thinking about such mystical and fallacious things as the "intrinsic value" of money or believe that gold somehow "backs up" our money or in some mysterious way gives it value.

For much of history, gold has been used as money by many countries. Sometimes the gold was used directly in coins or (for large purchases) in nuggets, gold bars or other forms. Even more convenient for carrying around were pieces of paper money printed by the government that were redeemable in gold whenever you wanted it redeemed. It was not only more convenient to carry around paper money, it was also safer than carrying large sums of money as metal that jingled in your pockets or was conspicuous in bags, attracting the attention of criminals.

The big problem with money created by the government is that those who run the government always face the temptation to create more money and spend it. Whether among ancient kings or modern politicians, this has happened again and again over the centuries, leading to inflation and the many economic and social problems that follow from inflation. For this reason, many countries have preferred using gold, silver, or some other material that is inherently limited in supply, as money. It is a way of depriving governments of the power to expand the money supply to inflationary levels. Gold has long been considered ideal for this purpose, since the supply of gold in the world usually cannot be increased rapidly. When paper money is convertible into gold whenever the individual chooses to do so, then the money is said to be "backed up" by gold. This expression is misleading only if we imagine that the value of the gold is somehow transferred to the paper money, when in fact the real point is that the gold simply limits the amount of paper money that can be issued.

The American dollar was once redeemable in gold on demand, but that was ended back in 1933. Since then, the United States has simply had paper money, limited in supply only by what officials thought they could or could not get away with politically. To give some idea of the cumulative effects of inflation, a one-hundred-dollar bill would buy less in 1998 than a twenty-dollar bill bought in the 1960s. Among other things, this means that people who saved money in the 1960s had four-fifths of its value silently stolen from them over the next three decades. Sobering as such inflation may be in the United States, it pales

alongside levels of inflation reached in some other countries. "Double-digit inflation" during a given year in the United States creates political alarms, but various countries in Latin America and Eastern Europe have had periods when the annual rate of inflation was in four digits.

21. 다음 글의 밑줄 친 부분 중, 어법상 틀린 것은?

In System 2, decision making tends to be thoughtful and deliberative, involving much more effort and time than System 1-related decision making. System 2 behavior also tends to be more flexible and therefore more subject to change-not hardwired. Kahneman argues that System 1 behavior can be more efficient in certain circumstances, but is more subject to systematic errors and biases. System 2 behavior is more efficient in other circumstances. And because System 2 behavior is deliberative and flexible, it is less subject to systematic errors and biases. So, an important aspect of this type of categorization of decision-making behavior is to determine which system works best and when, where, and for whom. Also of importance is the determination of the extent to which System 1 behavior is flexible in the longer term and the extent to which System 2 behavior is subject to errors and biases and, itself, is inflexible. The latter could occur, for example, when System 2 decision making is built upon deliberative but biased behavior and inaccurate mental models of how particular decisions affect outcomes. This approach to the categorization of decision making ties into the strand of behavioral economic research related to developing a better understanding how people make decisions in the real world and why and when decisions are effective and when they are not.

The study of emotions and decision making is now of considerable importance. This involves the application of various tools ① afforded by neuroscience. One important stream of the literature examines people with brain damage and how damage to particular parts of the brain ② knowing to be responsible for particular cognitive functions impacts on decision making. One example of this research is the work of Antonio Damasio, who finds that when the emotional part of the brain is damaged, this actually ③ reduces the efficacy of decision making. Good decisions are a product of the emotional part of the brain ④ working in conjunction with the deliberative part. This contradicts the assumptions of conventional economics, where emotions play a negative role in the decision-making process. Here it is assumed that decision making can be modeled as ⑤ generated in a stoic, unemotional fashion, and that's why decisions tend to be optimal. But the evidence suggests that emotions actually play an important and, often, a positive role in decision making.

Another stand of neuroscience examines the

importance of the chemistry of the brain and how this impacts on decisions and on the extent of good or bad behavior. An example of this research is work on the "moral molecule" by Paul Zak and colleagues. Here it is argued that an important determinant of morality is the extent to which higher or lower levels of the chemical oxytocin characterize an individual. This has given rise to more literature on the interplay between the chemistry of the brain and social and economic factors as determinants of decision making. There is also the important question of whether it is normative and institutionally affected behavior that causes critical levels of oxytocin, with oxytocin being an outcome rather than a cause.

22. 다음 글의 내용으로부터 추론할 수 없는 것은?

Customers confronted with thirty distinct types of premium chocolates are more prone to leaving without purchasing anything than when they are presented with merely six options. Employees receiving a complimentary Paris vacation feel satisfied. Similarly, those awarded a free Hawaiian getaway experience happiness. However, should you offer these individuals a selection between the two locations, their satisfaction diminishes regardless of what they select. What makes choice so disruptive? Choice compels individuals to make comparisons and recognize comparative disadvantages. Paris visitors complain that there are no beaches while Hawaii travelers miss the cultural institutions. This phenomenon, which psychologist Barry Schwartz terms the 'tyranny of choice,' paradoxically constrains our decision-making process instead of liberating it. According to his theory, wider options increase dissatisfaction since people fear making the wrong selection, causing anxiety while attempting to evaluate every comparison to ensure accuracy. This simultaneously increases our concern about poor choices and raises our expectations that optimal decisions should be achievable. After deciding, individuals begin experiencing regret, wondering if their selection was the appropriate one.

- ① Having more options increases the likelihood of leaving without making a purchase.
- ② When given choices, people tend to recognize comparative disadvantages.
- ③ Barry Schwartz introduced the concept of the 'tyranny of choice.'
- ④ Younger generations are more vulnerable to the tyranny of choice than older generations.
- ⑤ People can experience regret even after making their decisions.

23. 다음 글의 내용과 일치하는 것은?

As Linda arrived at a peaceful rural station, the train was surrounded by the soft murmur of travelers' conversations. After a two-year absence, Linda felt excited to reunite with her grandparents. She observed passengers getting onto the train and rushing to locate their seats. Soon afterward, a senior lady battled with a bulky suitcase, trying to

settle into the adjacent seat. Her petite frame made the luggage appear excessively large.

Being uncertain whether the senior lady would welcome assistance, Linda paused momentarily. Nevertheless, she decided to offer support shortly after. "Allow me to carry that suitcase for you," she offered. The senior lady unexpectedly collapsed, losing her footing before Linda could grab the luggage. She lay flat on her back, her complexion turned ashen. Linda remained motionless briefly, feeling the urgency of the circumstances. Several passengers hurried forward as she swiftly crouched near the fallen lady.

To verify if the senior lady was alright, Linda gently patted her shoulder. Making an effort to regain energy, the lady uttered weak sounds. Supporting the lady's back with one hand, Linda approached nearer. She comforted the lady quietly, "Everything's fine, take a minute to rest," while the lady's eyelids gradually parted. After assisting the lady to rise carefully, Linda guided her to the seat. Once the situation settled, surrounding passengers returned to their places.

Looking at Linda gratefully, the senior lady eventually relaxed. "Please forgive me," she explained. "The train's abrupt motion must have made me dizzy since I suffer from hypotension. I truly appreciate your assistance." Following a gentle acknowledgment, Linda shifted her attention toward the peaceful rural landscape. She realized that no matter how uncertain she might feel, providing even small assistance is far better than neglecting those requiring aid.

- ① Linda는 3년 만에 조부모를 만나러 가고 있었다.
- ② 노인 여성은 Linda의 도움 제안을 거절했다.
- ③ 노인 여성은 저혈압 때문에 어지러움을 겪는다고 설명했다.
- ④ Linda는 즉시 노인을 도와주기로 결심했다.
- ⑤ 주변 승객들은 상황이 정상화된 후에도 계속 지켜보고 있었다.
