The concept of ecosystem states should be familiar to anyone with a home vegetable garden. The garden is a small ecosystem that the grower attempts to keep in a specific state, namely the maximization of fruit and vegetable production. To achieve this, the grower is almost always intervening in the dynamics of the ecosystem; they remove unwanted plants that begin to grow and perhaps spray insecticides and fence off the patch to stop insects and other animals from consuming the vegetables. Since maximizing vegetable growth is an inherently unstable state for the ecosystem, the grower is effectively ----- . If the grower stops intervening, even for a day, the ecosystem, that small patch of ground, will naturally begin to shift to a more stable state. Vegetables may still grow, but yield will almost certainly be lower as other plants crowd out the vegetables and wildlife consume the produce.

Commitment is the glue holding together characteristically human forms of social life. Commitments make individuals' behavior predictable in the face of fluctuations in their desires and interests, thereby facilitating the planning and coordination of joint actions involving multiple agents. (A) -----, commitments make people willing to perform actions that they would not otherwise perform. (B) -----, a taxi driver picks up his clients and transports them to their desired destination because they are committed to paying him afterwards for the service, and a construction worker performs her job every day because her employer has made a credible commitment to pay her at the end of the month. Indeed, the taxi driver and the construction worker are willing to accept money as payment only because a network of other agents (notably the central bank) is committed to taking various measures to sustain the currency in question. Thus, social objects and institutions such as jobs, money, government, scientific collaborations and marriage depend for their origin and stability upon the credibility of commitments.

If the brain has already stored someone's face and name, why do we still end up remembering one and not the other? This is because the brain has something of a two-tier memory system at work when it comes to retrieving memories, and this gives rise to a common yet infuriating sensation: recognising someone, but not being able to remember how or why, or what their name is. This happens because the brain differentiates between familiarity and recall. To clarify, familiarity (or recognition) is when you encounter someone or something and you know you've done so before. But beyond that, you've got nothing; all you can say is this person/thing is already in your memories. Recall is when you can access the original memory of how and why you know this person: recognition is just flagging up the fact that the memory exists.

*retrieve: 꺼내다 **infuriating: 짜증 나는

- ① You cannot create new memories about the person.
- ② You have no ability to retrieve detailed information.
- ③ You have lost all previous memories about the person.
- ④ You are unable to store additional facial information.

The graph above shows the percentages of the primary reasons for E-bike purchase in five European countries in 2022. In Germany, recreational purpose accounted for the highest percentage of reasons for E-bike purchase, which was also the case in the Netherlands and Belgium. In Austria, the percentage of sporting activity was the highest at 41%, which was higher than that of commute to work. Switzerland was the only country where the percentage of recreational purpose was below 30%. The gap between the percentage of recreational purpose and that of sporting activity was smaller in Germany than in the Netherlands. The Netherlands and Belgium showed the same ranking order for reasons for E-bike purchase, where recreational purpose ranked first, followed by commute to work, while sporting activity ranked lowest.

The prominence of the social dimension in food writing might suggest that the flavor of food is taking a back seat. I suspect that most people view flavor as of secondary importance in social settings where food is served. Although our social gatherings coalesce around food, the meaning of these gatherings does not seem to depend on flavor. Flavor assists with the narrow purpose of filling the belly, and once that is accomplished it provides the backdrop for whatever social dynamics characterize the gathering. These can be understood independently of the flavor of the food on offer, the appreciation of which is understood to be personal and subjective. According to this conventional wisdom, the ceremonies and rituals around food, the social events that supply food with its meaning, do not depend on the quality of sensations provided by the food. To focus excessively on flavor is to miss the larger significance of these social relations.

Great scientists are seldom one-hit wonders. Newton is a prime example: beyond the Newtonian mechanics, he developed the theory of gravitation, calculus, laws of motion, and optimization. ① In fact, well-known scientists are often involved in multiple discoveries, a phenomenon potentially explained by the Matthew effect. ② Indeed, an initial success may offer a scientist legitimacy, improve peer perception, provide knowledge of how to score and win, enhance social status, and attract resources and quality collaborators, each of these payoffs further increasing her odds of scoring another win. ③ Scientific publications in peer-reviewed journals are essential for establishing credibility in academic communities. ④ Yet, there is an appealing alternative explanation: Great scientists have multiple hits and consistently succeed in their scientific endeavors simply because they're exceptionally talented. ⑤ Therefore, future success again goes to those who have had success earlier, not because of advantages offered by the previous success, but because the earlier success was indicative of a hidden talent. The Matthew effect posits that success alone increases the future probability of success, raising the question: Does status dictate outcomes, or does it simply reflect an underlying talent or quality? In other words, is there really a Matthew effect after all?

Despite the difference between the past and the future, between what has happened and what is to come, it can be suggested, that our sense of the past has always been influenced by our view of the future. Revolutionaries have always looked to the past to frame their future cause, as is amply illustrated by examples from nationalism to communism. The future has often been seen as variously a recovery of a lost time, as a replication of what is established, or as a model bequeathed by a heroic age long gone. The writing of history is based on understanding or explaining future outcomes that were not known to contemporaries, since the historian has the benefit of hindsight and the past is nothing more than the accumulation of futures that are now our past. So, rather than see the hand of the past always shaping the future, perhaps it can be seen in reverse, with the past - in the sense of our understanding of it - being shaped by our orientation to the future.

Dictionaries are relatively good resources for anyone interested in finding out what a word means. Using one set of words to define another word is called a *lexical definition*. But it's important to understand the limits of dictionary definitions. More often than not, a definition in a dictionary requires readers to have a fairly robust understanding of the language already at their disposal. In other words, a dictionary functions in many cases as a cross-reference or translator between words one knows and words that one doesn't yet know. Even the most obscure words in a dictionary, say, for example, "pulchritudinous" or "kalokagathia," must be defined using words that the reader already knows and understands. Otherwise, the dictionary isn't very helpful.

The governments of virtually every country on the planet attach great importance to achieving food security and a wide variety of mechanisms have been developed to realize this goal. The first issue governments face in achieving national food security is the problem of insuring that adequate amounts of food are available to the resident population. Some governments have set goals of food self-sufficiency, which means most if not all of the food available in a country comes from the domestic farming system. However, food security does not require food self-sufficiency because countries can import food items not easily produced within the country. Agricultural products are, after all, highly sensitive to climatic, soil and other conditions that tend to vary around the world. Even countries with extremely productive agricultural sectors are not fully self-sufficient in all food items. The United States, for example, depends on imports for its supply of coffee, tea, bananas and other tropical products. In general, the problem of assuring adequate food supplies is solved by -----.

- ① relying on both domestic production and imports
- ② implementing strict import regulations on foreign foods
- ③ maximizing domestic agricultural production capacity
- ④ prioritizing food self-sufficiency over other economic goals
- ⑤ developing agricultural technology to grow all necessary foods

Stress not only affects physical disease but also the very structure of our brains, making us even more likely to experience a drained brain. A number of studies have been done to reveal what happens in healthy people's brains when they go through something stressful. ① One study demonstrated a link between a smaller hippocampus and people who had experienced long-lasting stress. ② Why does this matter? This part of the brain helps you remain resilient in the face of stress and is involved in mood regulation. ③ Some researchers argue that regular physical exercise can completely reverse brain damage caused by chronic stress. ④ It also helps you to monitor the safety of your environment and store dangerous images in your long-term memory so you can avoid them in the future. ⑤ It does all these things as part of its duties of regulating your sympathetic and parasympathetic nervous systems. It is important to recognize that although science is a rule-based procedure, it is very much a creative process. A conjecture is a philosophical invention, cooked up rather mystically by the mind through the mental computation we call careful contemplation. However, until the hypothesis is tested against reality, it is not yet truly knowledge; it is just information that represents speculation. Knowledge is information that has demonstrated its usefulness. It is what is left over after cycles of experimental testing have eliminated false theories. As scientists continually test their hypotheses and modify their models to account for new and surprising data, a kind of "learning loop" emerges that statisticians call *Bayesian updating*. Based on Bayes' Rule, developed by eighteenth-century English statistician and philosopher Thomas Bayes, Bayesian updating refers to a mathematical process whereby an accepted theory or predictive model gets increasingly accurate through the repetitive testing of competing variants of that theory.

As a general rule, it's better if your definition corresponds as closely as possible to the way in which the term is ordinarily used in the kinds of debates to which your claims are pertinent. There will be, however, occasions where it is appropriate, even necessary, to coin special uses through what philosophers call stimulative definition. This would be the case where the current lexicon is not able to make distinctions that you think are philosophically important. For example, we do not have a term in ordinary language that describes a memory that is not necessarily a memory of something the person having it has experienced. Such a thing would occur, for example, if I could somehow share your memories: I would have a memory-type experience, but this would not be of something that I had actually experienced. To call this a memory would be misleading. For this reason, philosophers have coined the special term 'quasi-memory' to refer to these hypothetical memory-like experiences.

Quite often the interaction between groups is socially unequal, and this is reflected in the fact that in many cases borrowing of words or constructions goes mostly or entirely in one direction, from the more powerful or prestigious group to the less favored one. The languages of socially subordinated groups may from quite an early period of contact provide terminology for objects or practices with which speakers of the more powerful group were previously unfamiliar, but the effects of contact in that direction may not progress any further than this. In 1900, at the close of the first decade in which electric systems had become a practical alternative for manufacturers, less than 5 percent of the power used in factories came from electricity. But the technological advances of suppliers made electric systems and electric motors ever more affordable and reliable, and the suppliers' intensive marketing programs also sped the adoption of the new technology. Further accelerating the shift was the rapid expansion in the number of skilled electrical engineers, who provided the expertise needed to install and run the new systems. In short order, electric power had gone from exotic to commonplace.

But one thing didn't change. Factories continued to build their own power-supply systems on their own premises. Few manufacturers considered buying electricity from the small central stations. Designed to supply lighting to local homes and shops, the central stations had neither the size nor the skill to serve the needs of big factories. And the factory owners, having always supplied their own power, were loath to assign such a critical function to an outsider. They knew that a glitch in power supply would bring their operations to a halt - and that a lot of glitches might well mean bankruptcy. As the new century began, a survey found that there were already 50,000 private electric plants in operation, far surpassing the 3,600 central stations.

* premises: (공장) 부지 ** glitch: (작은) 결함

Commitment is the glue holding together characteristically human forms of social life. Commitments make individuals' behavior predictable in the face of fluctuations in their desires and interests, thereby facilitating the planning and coordination of joint actions involving multiple agents. Moreover, commitments make people willing to perform actions that they would not otherwise perform. For example, a taxi driver picks up his clients and transports them to their desired destination because they are committed to paying him afterwards for the service, and a construction worker performs her job every day because her employer has made a credible commitment to pay her at the end of the month. Indeed, the taxi driver and the construction worker are willing to accept money as payment only because a network of other agents (notably the central bank) is committed to taking various measures to sustain the currency in question. Thus, social objects and institutions such as jobs, money, government, scientific collaborations and marriage depend for their origin and stability upon the credibility of commitments.

*fluctuation: 동요

- ① Commitments enable the stability of social institutions.
- ② Commitments make individual behavior predictable.
- ③ Commitments cause people to perform actions they would not otherwise perform.
- ④ Commitments serve as a means to resolve social inequality.
- ⑤ Commitments facilitate the coordination of joint actions involving multiple agents.

If the brain has already stored someone's face and name, why do we still end up remembering one and not the other? This is because the brain has something of a two-tier memory system at work when it comes to retrieving memories, and this gives rise to a common yet infuriating sensation: recognising someone, but not being able to remember how or why, or what their name is. This happens because the brain differentiates between familiarity and recall. To clarify, familiarity (or recognition) is when you encounter someone or something and you know you've done so before. But beyond that, you've got nothing; all you can say is this person/thing is already in your memories. Recall is when you can access the original memory of how and why you know this person: recognition is just flagging up the fact that the memory exists.

*retrieve: 꺼내다 **infuriating: 짜증 나는

The phenomenon of recognizing someone but being unable to (A)_____ their name or how we know them occurs because the brain (B)_____ between familiarity and recall.

Since their start in the early 1950s U.S. television sitcoms have charted many of the social conflicts in U.S. society: civil rights, women's rights in the home and in the workplace, children's rights, immigration and multiculturalism, as well as evolving conceptions of the family. Each of these issues has been addressed through humour in a way that has helped to make more progressive values more acceptable than previously. Often a character, usually someone marked as a bigot, resisted one or more of these developments and was then made to appear ridiculous. They were cut down either through their own stupidity, a brief scolding from others, or both. In this way, the humour of sitcoms acted as a cost-effective means to encourage acceptance of a more pluralistic and tolerant society.

* bigot: 편견이 아주 심한 사람

** pluralistic: 다원적인

Question: How were characters who resisted progressive values portrayed in sitcoms?

- ① They were shown as intelligent role models.
- ② They were completely removed from most sitcom storylines.
- ③ They were presented as heroes defending traditional values.
- ④ They were depicted as sympathetic individuals struggling with change.
- ⑤ They were made to look ridiculous through their actions or others' criticism.

Friedrich Mohs, a well-known mineralogist, was born on January 29, 1773, in Gernrode, Germany. He displayed a marked interest in science at an early age. He studied chemistry, mathematics, and physics at the University of Halle and also studied mineralogy at the Mining Academy. In his late twenties, he went to Austria and classified minerals by their physical attributes. This new classification system of his led to conflicts with many mineralogists who followed the conventional methods. In 1812, Mohs was appointed Professor of Mineralogy at the Joanneum, where he developed the Mohs Scale of Mineral Hardness. Mohs ended his remarkable career at the Mining University in Leoben and died at the age of 66 in Italy.

The prominence of the social dimension in food writing might suggest that the flavor of food is taking a back seat. I suspect that most people view flavor as of secondary importance in social settings where food is served. Although our social gatherings coalesce around food, the meaning of these gatherings does not seem to depend on flavor. ① Flavor assists with the narrow purpose of filling the belly, and once that is accomplished it provides the backdrop for whatever social dynamics characterize the gathering. ② These can be understood independently of the flavor of the food on offer, the appreciation of which is understood to be personal and subjective. ③ Neuroscientists have discovered that taste perception activates the same brain regions involved in processing emotional memories and social bonding. ④ According to this conventional wisdom, the ceremonies and rituals around food, the social events that supply food with its meaning, do not depend on the quality of sensations provided by the food. ⑤ To focus excessively on flavor is to miss the larger significance of these social relations.

36. 다음 글에서 밑줄 친 Matthew effect가 의미하는 바로 가장 적절한 것은?

Great scientists are seldom one-hit wonders. Newton is a prime example: beyond the Newtonian mechanics, he developed the theory of gravitation, calculus, laws of motion, and optimization. In fact, well-known scientists are often involved in multiple discoveries, a phenomenon potentially explained by the Matthew effect. Indeed, an initial success may offer a scientist legitimacy, improve peer perception, provide knowledge of how to score and win, enhance social status, and attract resources and quality collaborators, each of these payoffs further increasing her odds of scoring another win. Yet, there is an appealing alternative explanation: Great scientists have multiple hits and consistently succeed in their scientific endeavors simply because they're exceptionally talented. Therefore, future success again goes to those who have had success earlier, *not* because of advantages offered by the previous success, but because the earlier success was indicative of a hidden talent. The Matthew effect posits that success *alone* increases the future probability of success, raising the question: Does status dictate outcomes, or does it simply reflect an underlying talent or quality? In other words, is there really a Matthew effect after all?

* posit: 상정하다

- ① The tendency of successful scientists to always use the same methodology
- ② The phenomenon where scientific discoveries are triggered by accidental events
- ③ The phenomenon where success itself increases the likelihood of additional success
- ④ The ability of talented scientists to succeed in multiple fields
- ⑤ The process by which scientists achieve results through collaboration with colleagues

When we realize we've said something in error and we pause to go back to correct it, we stop gesturing a couple of hundred milliseconds before we stop speaking. Such sequences suggest the startling notion that our hands "know" what we're going to say before our conscious minds do, and in fact this is often the case. Gesture can mentally prime a word so that the right term comes to our lips. When people are prevented from gesturing, they talk less fluently: their speech becomes halting because their hands are no longer able to supply them with the next word, and the next. Not being able to gesture has other deleterious effects: without gesture to help our mental processes along, we remember less useful information, we solve problems less well, and we are less able to explain our thinking. Far from tagging along as speech's clumsy companion, gesture represents the leading edge of our thought.

* startling: 놀라운 ** deleterious: 해로운

What happens when people are not allowed to gesture while speaking?

- ① They speak more clearly and articulately.
- ② They become more aware of their speech patterns.
- ③ They experience improved memory function.
- ④ Their speech becomes less fluent and more halting.
- ⑤ They rely more heavily on conscious thinking.

Despite the difference between the past and the future, between what has happened and what is to come, it can be suggested, that our sense of the past has always been influenced by our view of the future. ① Revolutionaries have always looked to the past to frame their future cause, as is amply illustrated by examples from nationalism to communism. ② Modern technology has rapidly transformed how we document and preserve historical records in digital formats. ③ The future has often been seen as variously a recovery of a lost time, as a replication of what is established, or as a model bequeathed by a heroic age long gone. ④ The writing of history is based on understanding or explaining future outcomes that were not known to contemporaries, since the historian has the benefit of hindsight and the past is nothing more than the accumulation of futures that are now our past. ⑤ So, rather than see the hand of the past always shaping the future, perhaps it can be seen in reverse, with the past - in the sense of our understanding of it - being shaped by our orientation to the future.

Dictionaries are relatively good resources for anyone interested in finding out what a word means. Using one set of words to define another word is called a *lexical definition*. But it's important to understand the limits of dictionary definitions. More often than not, a definition in a dictionary requires readers to have a fairly robust understanding of the language already at their disposal. In other words, a dictionary functions in many cases as a cross-reference or translator between words one knows and words that one doesn't yet know. Even the most obscure words in a dictionary, say, for example, "pulchritudinous" or "kalokagathia," must be defined ----- . Otherwise, the dictionary isn't very helpful.

- ② using words that the reader already knows and understands
- ③ with technical terminology that precisely captures meaning
- ④ by referencing more common synonyms in different languages
- ⑤ according to standardized formatting requirements for dictionaries

The governments of virtually every country on the planet attach great importance to achieving food security and a wide variety of mechanisms have been developed to realize this goal. The first issue governments face in achieving national food security is the problem of insuring that adequate amounts of food are available to the resident population. Some governments have set goals of food self-sufficiency, which means most if not all of the food available in a country comes from the domestic farming system. However, food security does not require food self-sufficiency because countries can import food items not easily produced within the country. Agricultural products are, after all, highly sensitive to climatic, soil and other conditions that tend to vary around the world. Even countries with extremely productive agricultural sectors are not fully self-sufficient in all food items. The United States, for example, depends on imports for its supply of coffee, tea, bananas and other tropical products. In general, the problem of assuring adequate food supplies is solved by relying on both domestic production and imports.

While some countries aim for food ___(A)___, achieving food security actually requires a balanced approach that combines domestic production with ___(B)___ to ensure adequate food supplies.

Stress not only affects physical disease but also the very structure of our brains, making us even more likely to experience a drained brain. A number of studies have been done to reveal what happens in healthy people's brains when ㉠ they go through something stressful. One study demonstrated a link between a smaller hippocampus and people who had experienced long-lasting stress. Why does this matter? It is important to recognize that although science is a rule-based procedure, it is very much a creative process. A conjecture is a philosophical invention, cooked up rather mystically by the mind through the mental computation we call careful contemplation. However, until the hypothesis is tested against reality, it is not yet truly knowledge; it is just information that represents speculation. Knowledge is information that has demonstrated its usefulness. It is what is left over after cycles of experimental testing have eliminated false theories. As scientists continually test their hypotheses and modify their models to account for new and surprising data, a kind of "learning loop" emerges that statisticians call *Bayesian updating*. Based on Bayes' Rule, developed by eighteenth-century English statistician and philosopher Thomas Bayes, Bayesian updating refers to a mathematical process whereby an accepted theory or predictive model gets increasingly ----- through the repetitive testing of competing variants of that theory.

As a general rule, it's better if your definition corresponds as closely as possible to the way in which the term is ordinarily used in the kinds of debates to which your claims are pertinent. There will be, however, occasions where it is appropriate, even necessary, to coin special uses through what philosophers call stimulative definition. This would be the case where the current lexicon is not able to make distinctions that you think are philosophically important. For example, we do not have a term in ordinary language that describes a memory that is not necessarily a memory of something the person having it has experienced. Such a thing would occur, for example, if I could somehow share your memories: I would have a memory-type experience, but this would not be of something that I had actually experienced. To call this a memory would be misleading. For this reason, philosophers have coined the special term 'quasi-memory' to refer to these hypothetical memory-like experiences.

But the technological (A) advances / setbacks of suppliers made electric systems and electric motors ever more affordable and reliable, and the suppliers' intensive marketing programs also sped the adoption of the new technology. Further accelerating the shift was the rapid expansion in the number of skilled electrical engineers, who provided the expertise needed to install and run the new systems. But one thing didn't change. Factories continued to build their own power-supply systems on their own premises. Few manufacturers considered buying electricity from the small central stations. Ms. Blake walked along the edge of the soccer field, watching Eva pack up her things after practice. She paused for a moment, then called out, "Hey, Eva! How about staying a little longer? We can work on some drills - just the two of us." Eva hesitated. "I don't know, Coach. I'm pretty tired." Ms. Blake gave her a warm smile. "Just ten minutes. It'll be fun. I promise." Finally, Eva agreed, though she still seemed reluctant. They practiced passing the ball together.

Ms. Blake noticed that Eva's movements were slow and that her focus seemed elsewhere. Breaking the silence, Ms. Blake asked, "Do you remember the final game last year?" "Yeah, I remember." Eva recalled the game where she scored three goals. "I was quite good back then." "You still are," replied Ms. Blake. "Well, now I'm so worried I can't score a goal or even pass the ball properly. I'm afraid of making mistakes," said Eva.

Ms. Blake stepped closer and placed a reassuring hand on Eva's shoulder. She suggested, "You don't have to be perfect. Soccer isn't about perfection - it's about passion. And you've always had plenty of that." Eva's gaze met Ms. Blake's. "Do you really think so?" Ms. Blake said firmly, "Yes. The way you play, the energy you bring - that's what makes you special. Not the goals scored or the trophies won. It's the love you have for the game." Eva nodded thoughtfully.

The next game, Ms. Blake watched from the sidelines as Eva played. There was a new confidence that hadn't been there before. Eva didn't score but led the team successfully. After the game she ran over, saying, "Thanks for believing in me, Coach." Ms. Blake smiled back. "You've always had it in you. I'm just here to remind you of that." Eva's face softened, as she realized she had been too hard on herself. She said to herself, "What matters is doing my best, not being perfect."

- ① Eva scored three goals in the final game last year.
- ② Eva immediately accepted Ms. Blake's offer to do extra practice after training.
- ③ Eva lost her confidence because she was afraid of making mistakes.
- ④ Ms. Blake advised Eva that passion is more important than perfection in soccer.
- ⑤ Eva didn't score in the next game but successfully led her team.

[해설] 이 글은 음식 중심의 사회적 모임에서 맛이 부차적인 역할을 한다는 내용을 일관되게 다루고 있다. 사회적 모임의 의미는 음식의 맛에 의존하지 않으며, 맛은 단지 배를 채우는 좁은 목적을 위한 것이고, 음식 관련 의식과 의례는 음식이

제공하는 감각의 질에 의존하지 않는다는 주장을 전개하고 있다. 그러나 ③ "신경과학자들은 맛 인식이 감정적 기억과 사회적 유대 처리에 관여하는 동일한 뇌 영역을 활성화한다는 것을 발견했다"라는 문장은 맛과 사회적 유대 간의 신경학적 연결성을 언급하는 내용으로, 맛이 사회적 맥락에서 부차적이라는 글의 주요 논지와 맞지 않는다.

[해설] (A) 문맥상 공급업체의 기술적 "advances(발전, 진보)"가 적절하다. 전기 시스템과 모터를 더 저렴하고 신뢰할 수 있게 만들었다는 내용이므로 "setbacks(후퇴, 장애)"보다는 "advances"가 자연스럽다. (B) 공장 소유주들이 중요한 기능을 외부인에게 맡기는 것을 "loath(꺼리는, 싫어하는)"한다는 것이 문맥에 맞다. 이 글에서 공장들이 자체 전력 공급 시스템을 계속 구축했다고 했으므로 "eager(열망하는)"가 아니라 "loath"가 적절하다. (C) 전력 공급의 "glitch(사소한 장애)"가 공장 운영을 중단시킬 수 있다는 맥락이므로 "breakthrough(돌파구, 획기적 발전)"보다는 "glitch"가 맞다.
